# Lecture Outline

1. Array
2. File Parsing from Shell Script
3. File Parsing With Separator
4. Checking file existence

# Array

- ❑ Bash Supports simple single dimension array
- ❑ In bash you can add value in any array position
- ❑ Gaps in indices are okay in bash
- ❑ You can treat any variable as an array but the value will be assigned into the **0th index**
- ❑ Syntax

```
os=('ubuntu', 'windows', 'linux')
```

```
echo "${os[0]}"
```

```
echo "${os[1]}"
```

```
echo "${os[2]}"
```

# Array (cont'd)

- ❑ Get the length of the array

```
echo "${#os[@]}"
```

- ❑ Removing value from array

```
unset os[2]
```

- ❑ Taking array as an input

```
read -a variablename [separate input with space and then  
press enter]
```

# File Parsing from Shell Script

- ❑ File can be viewed with **cat command** easily.
- ❑ We can also parse file from shell script.
- ❑ For **parsing file**; we need **input redirection** of file.
- ❑ Input redirection means the read command will read from file rather taking input from terminal.
- ❑ Input redirection is done by **< operator**.
- ❑ **File** is **read** by **while loop**.

# Syntax

```
#!/bin/bash
```

```
while read filecontent
```

```
do
```

```
    echo $filecontent
```

```
done < filename
```

This will read the whole content of the file and give output in terminal.

# File Parsing With Separator

Suppose we want to parse the file and its contents

For example; the below is a content of a file

Name-ID

Tanvir Ahmed-123466

Sabbir Ahmed-456792

Masum Ahmed-454679

Here you can see the name and id are separated by -.

This is a separator. In many files Linux uses separator to separate file contents.

# Example

- ❑ Run `cat /etc/passwd`

- ❑ This file contains the user information like username, password, user home directory etc.

See the below content. This contains username and user's home directory.

`uidd:/usr/sbin/nologin`

`dnsmasq:/usr/sbin/nologin`

`landscape:/usr/sbin/nologin`

`sshd:/usr/sbin/nologin`

- ❑ Here the contents are separated with : (colon). So, to read the attribute like user and user's home directory independently we have to use File Separator.
- ❑ To do so we need to use **IFS = Internal Field Separator**. It basically separates word with a separator.

# Syntax

```
while IFS=: read username userhomedirectory; do  
    echo $username $userhomedirectory  
done < filename
```

```
uidd /usr/sbin/nologin  
dnsmasq /usr/sbin/nologin  
landscape /usr/sbin/nologin  
sshd /usr/sbin/nologin
```

Output of the above code.

For reading n attribute we need to use n variables. As we are reading 2 attributes we are using 2 variables.

# Checking file existence

```
filename=info.txt
```

```
if [ -f $filename ]
```

```
then
```

```
    #do operation
```

```
else
```

```
    echo "File not exists"
```

**Here the `-f` flag checks for the existence of the file.**

# Books

- ❑ Unix Shell Programming
  - ❑ Written by Yashavant P. Kanetkar
